Furutech One piece Wound-Wire conductor Binding Posts FT-867 series

All audiophiles search for the same qualities: Verisimilitude to the original event, a sense of engagement promoting suspension of disbelief, a visceral immersion in the audio video experience. They also know that everything in the signal path makes a difference, and that includes speaker binding posts.

This critical connection often proves the weakest link in the quest for tight, low-distortion signal.

Furutech's unique patent-pending wound-wire conductor construction binding posts sit at the very highest rung of build quality and musical performance, maintaining the most noise-free and undistorted signal path possible.

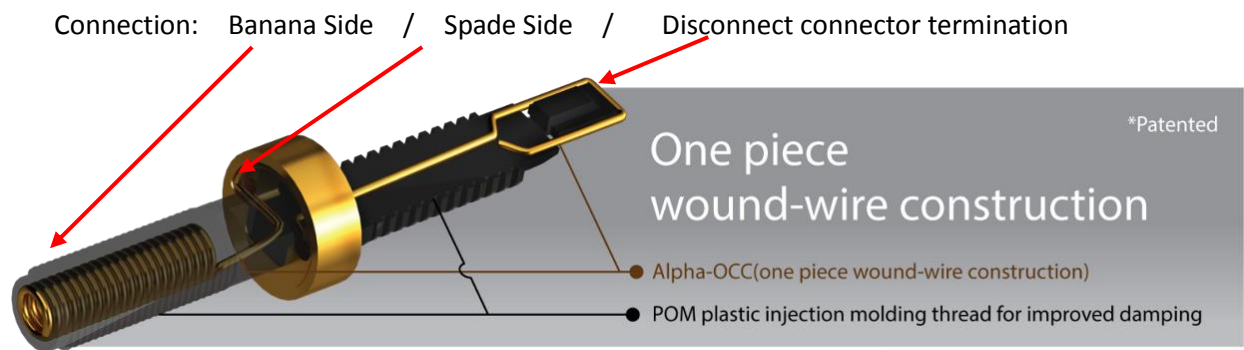

Furutech's beautifully finished, beautiful sounding Binding Posts are the result of meticulous engineering and careful audition of various suitable materials. The FT-867 series features a one piece wound-wire Alpha-OCC conductor. This special conductor allows for reduced metal mass in the binding post terminal pole construction resulting in minimal impedance and less susceptibility to the negative effects of RFI and magnetic fields. Also the environmentally friendly construction process of the wound-wire conductor means less metal waste compared to conventional CNC, mold or pressing processes.

The FT-867 series fitted with Nylon/fiberglass with piezo ceramic and carbon damping material housing.

Features and Materials

- Patent-pending One piece wound-wire construction
- Main conductor: Rhodium or 24k Gold plated α (Alpha)-OCC wound-wire conductor
- Housing: Nylon/fiberglass with piezo ceramic and carbon damping material
- POM plastic injected terminal pole
- Nylon (red/white) and Polycarbonate insulation
- Connections: Disconnect connector termination
- Specified for core diameters up to 4.5mm
